A b s t r a c t

The invention relates to a method for providing a mobile subscriber with data via a communication network, to which mobile subscriber a directory number is assigned and which communication network is capable of transmitting data addressed to said directory number. In order to improve the possibilities of re-directing service data, it is proposed that upon a request by the mobile subscriber to the communication network, data for at least one kind of telecommunication service addressed to the directory number is re-directed by the communication network to an internet address defined by said mobile subscriber. The invention equally relates to a corresponding mobile terminal, to a corresponding communication network and to a communication system comprising such a mobile terminal and such a communication network.
